Computational methods for data integration

Karan Uppal, PhD
Assistant Professor of Medicine
Director of Computational Metabolomics & Integrative Omics, Clinical Biomarkers Laboratory
Emory University

Disclosure of Conflict of Interest

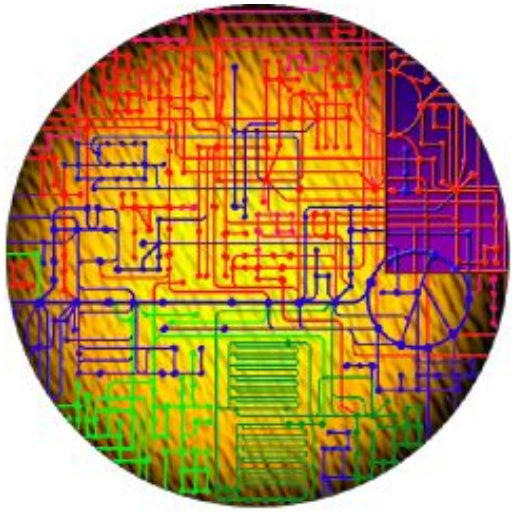
- I have no actual or potential conflict of interest in relation to this presentation.

Learning Objectives

- Understanding of different data integration approaches
- Familiarity with tools for data integration and network visualization

Introduction: A Systems Biology Framework

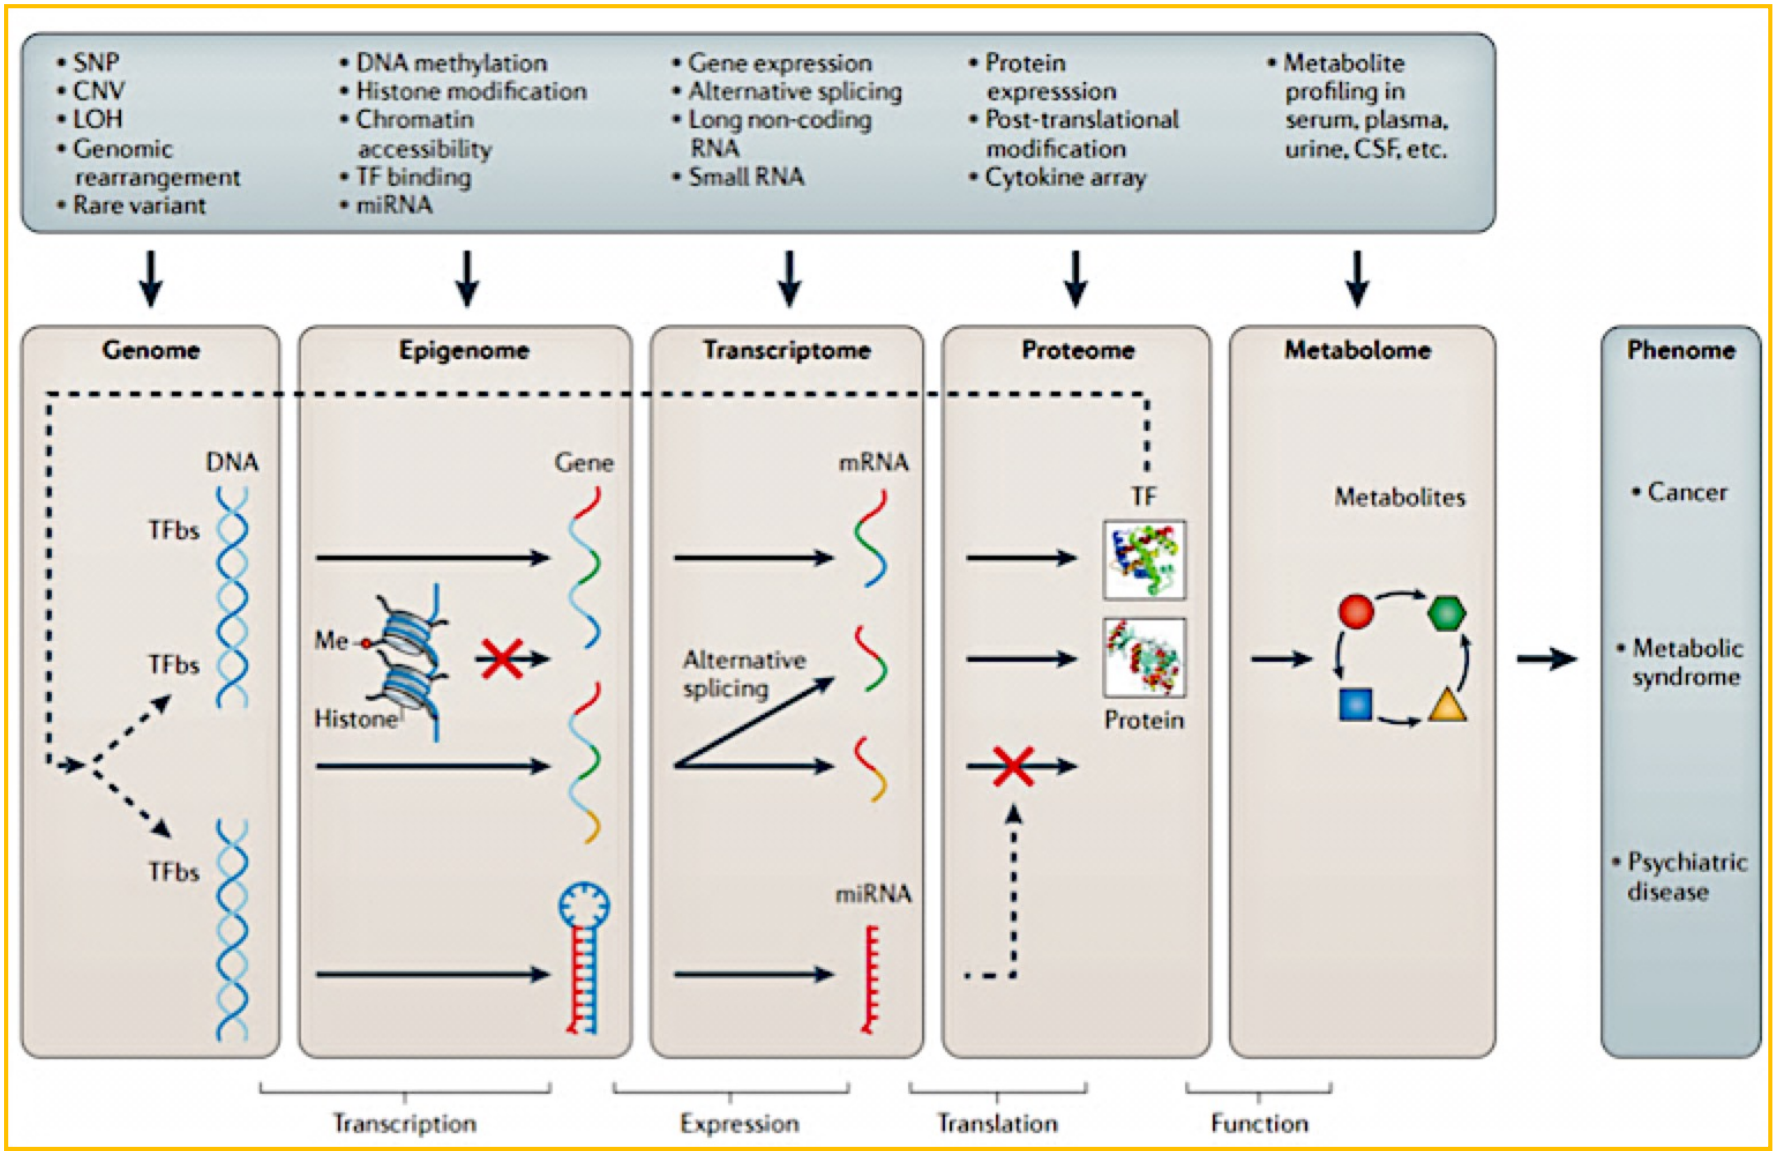
- The goal of **Systems Biology**:
  - Systems-level understanding of biological systems
  - Analyze not only individual components, but their interactions as well and emergent behavior



Exposures
Internal measurements
Disease states

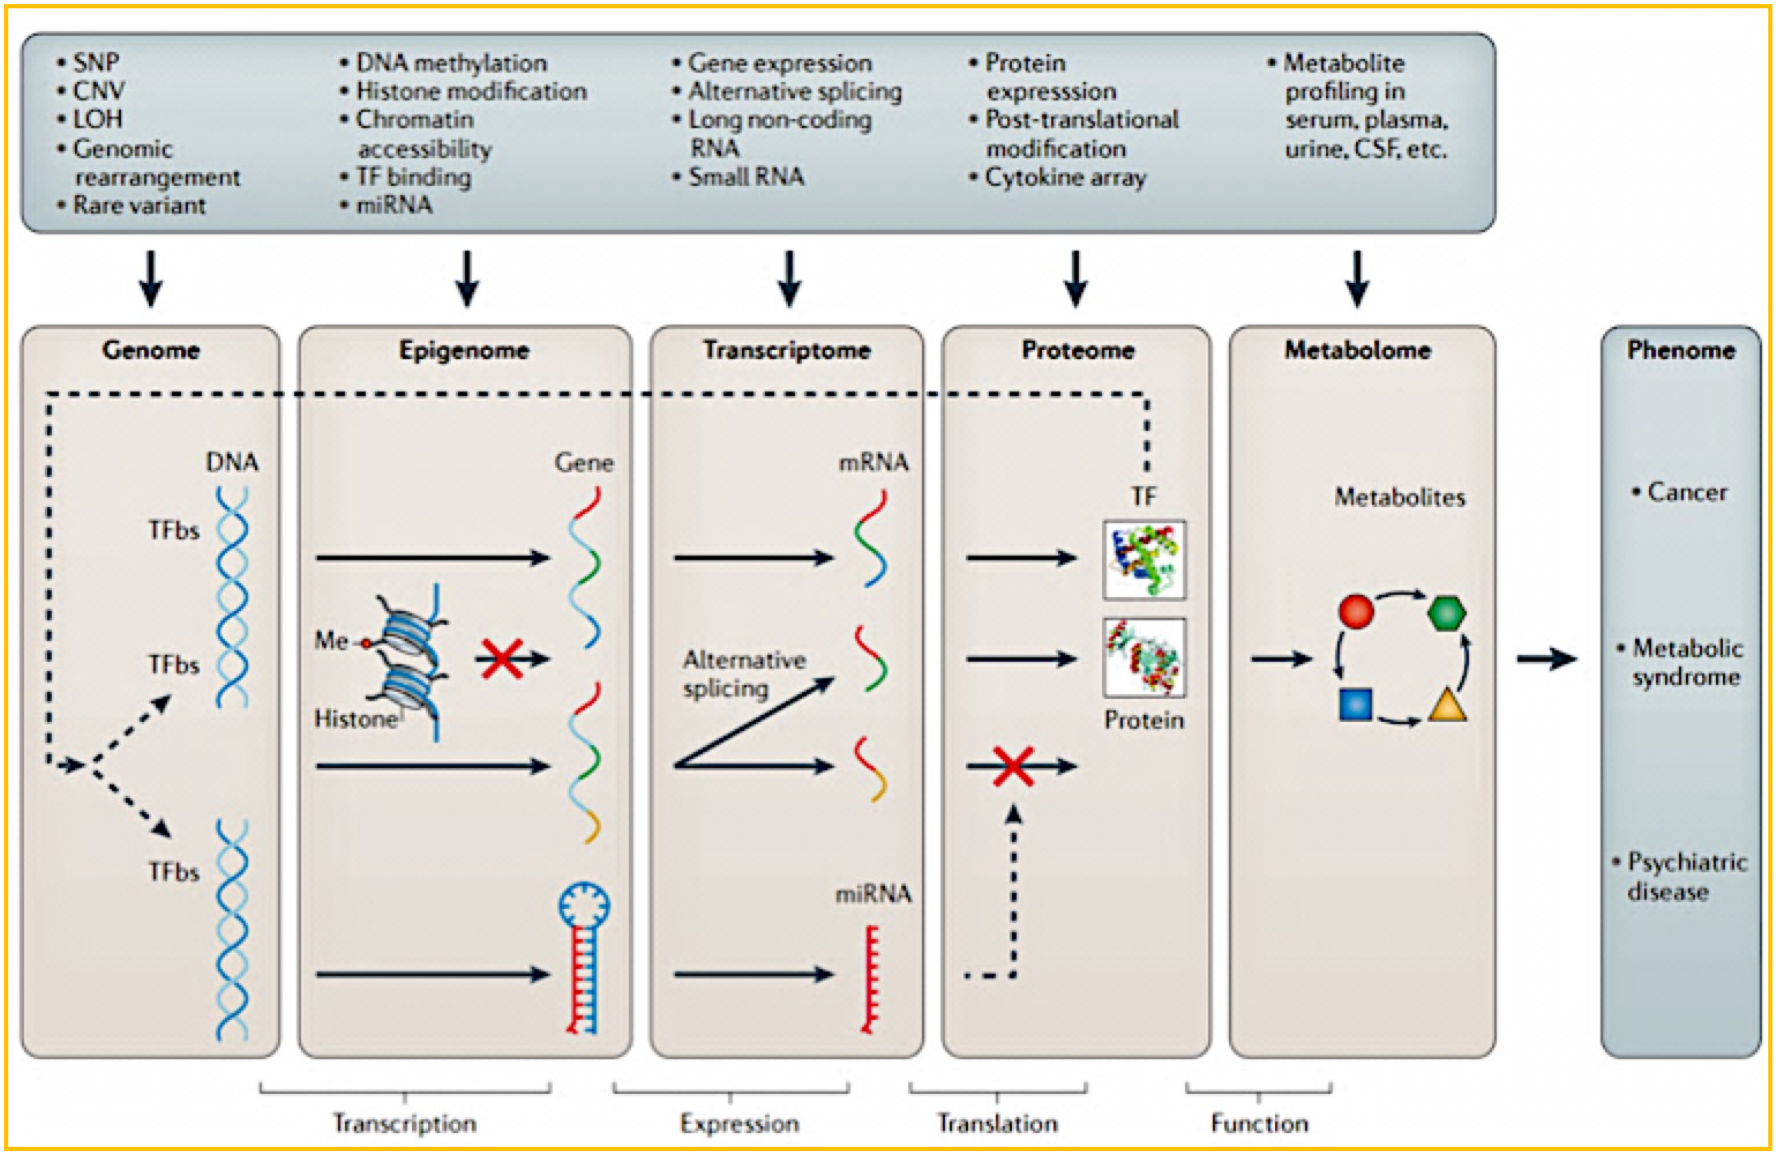
Systems Biology
"*Integrative approach in which scientists study pathways and networks will touch all areas of biology, including drug discovery*"
C. Henry and C. Washington

Integrative omics: dissecting the biological system via -omics



Ritchie MD, Holzinger ER, Li R, Pendergrass SA, Kim D. 2015. Methods of integrating data to uncover genotype-phenotype interactions. Nat Rev Genet *16:85-97.*

“Information Overload”: >10,000 variables per –omics experiment



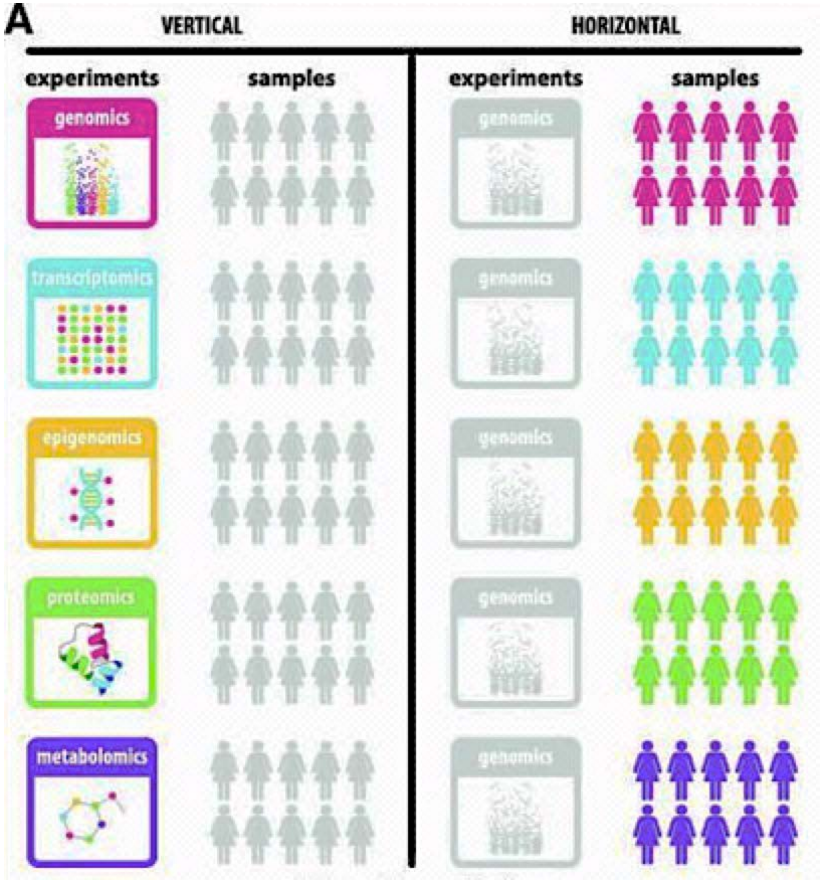
Ritchie MD, Holzinger ER, Li R, Pendergrass SA, Kim D. 2015. Methods of integrating data to uncover genotype-phenotype interactions. Nat Rev Genet *16:85-97.*

Why data integration?

- Systems level analysis provides:
  - more detailed overview of underlying mechanisms;
  - exploration of interactions between different biomedical entities (genes, proteins, metabolites, etc.)
- Combining multiple types of data collected on the same subjects compensates for noise or unreliable information in a single data type
- More confidence in results if multiple sources of evidence pointing to the same gene or pathway

Data integration study designs

- Paired or vertical integrative analysis
  - Integrative analysis of **multiple omics datasets** from the **same N subjects**
  - Discover networks of associations or correlated variables (e.g. genes, proteins, metabolites, microbiome, epigenetic alterations, clinical variables)
    - Univariate or multivariate regression
    - Example: explaining protein abundance with respect to gene expression
- Horizontal integrative analysis
  - Meta-analysis of **multiple studies/cohorts** looking at the same type of data
  - Cross-laboratory or cross-platform comparisons



Eidem 2018, BMC Med Genomics

Main approaches for data integration

- Pathway-based integration
  - Pathway information from KEGG or other databases
  - Datasets are analyzed individually (differentially expressed genes, metabolites, proteins) and integration is performed at the pathway level
  - Examples: MetaboAnalyst, iPEAP, MetScape, MetaCore
- Data-driven integration using meta-dimensional analysis
  - Integration is performed globally such that data from multiple omics layers are combined simultaneously
  - Interpretation using pathway analysis tools
  - Examples: 3Omics, mixOmics, xMWAS
- Using literature-derived associations for integration
  - Using co-occurrence criteria for establishing relationship
  - Examples: HiPub, CoPub, ArrowSmith

Main approaches for data integration

- **Pathway-based integration**
  - **Pathway information from KEGG or other databases**
  - **Datasets are analyzed individually (differentially expressed genes, metabolites, proteins) and integration is performed at the pathway level**
  - **Examples: MetaboAnalyst, iPEAP, MetScape, MetaCore**
- Data-driven integration using meta-dimensional analysis
  - Integration is performed globally such that data from multiple omics layers are combined simultaneously
  - Interpretation using pathway analysis tools
  - Examples: 3Omics, mixOmics, xMWAS
- Using literature-derived associations for integration
  - Using co-occurrence criteria for establishing relationship
  - Examples: HiPub, CoPub, ArrowSmith

Pathway-based data integration - I

Metabolomics data

Differentially expressed genes

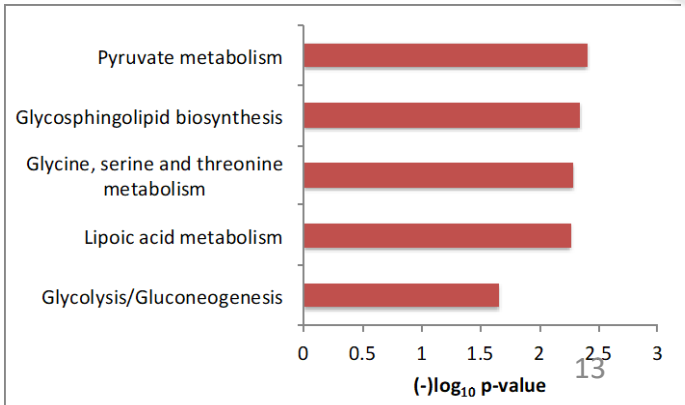
MetaboAnalyst4.0 – Joint Pathway Analysis module

Over-representation analysis in KEGG using gene and metabolite IDs

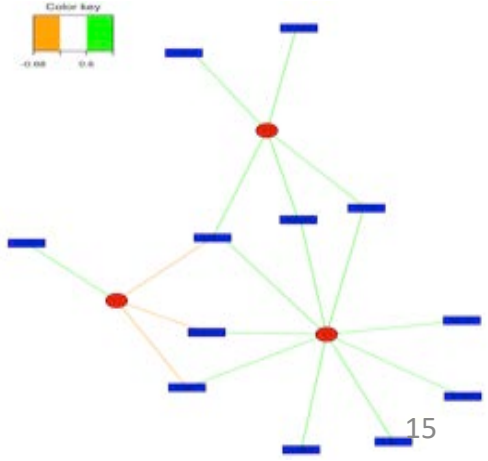


Main approaches for data integration

- Pathway-based integration
  - Pathway information from KEGG or other databases
  - Datasets are analyzed individually (differentially expressed genes, metabolites, proteins) and integration is performed at the pathway level
  - Examples: MetaboAnalyst, iPEAP, MetScape, MetaCore
- **Data-driven integration using meta-dimensional analysis**
  - **Integration is performed globally such that data from multiple omics layers are combined simultaneously**
  - **Interpretation using pathway analysis tools**
  - **Examples: 3Omics, mixOmics, xMWAS**
- Using literature-derived associations for integration
  - Using co-occurrence criteria for establishing relationship
  - Examples: HiPub, CoPub, ArrowSmith

Relevance networks

- What is a network (or graph)?
  - A set of nodes (vertices) and edges (links)
  - Edges describe a relationship (e.g. correlation) between the nodes
- What is a relevance network?
  - Networks of highly-correlated biomedical/clinical entities (Butte 2000; PNAS)
  - Metabolomics x Proteomics, Transcriptomics x Proteomics, Metabolomics x Microbiome, Metabolomics x Clinical variables/phenotypes, etc.
  - Generate a bipartite graph network using a association threshold (e.g. 0.5) to visualize positive or negative associations



Circles: genes
Rectangles: metabolites

Methods for generating relevance networks

- Univariate
  - 3Omics (Kuo 2013; a web-based tool for analysis, integration and visualization of human transcriptome, proteome and metabolome data)
  - MetabNet (Uppal 2015; R package for performing pairwise correlation analysis and generating relevance networks)
- Multivariate
  - Multivariate regression techniques such as partial least squares (PLS), sparse partial least squares regression (sPLS), multilevel sparse partial least squares (msPLS) regression, etc.
  - mixOmics (Cao et al. 2009, Liquet et al. 2012; R package for integration and variable selection using multivariate regression)
  - xMWAS (Uppal 2018): a data-driven integration and differential network analysis
    - Availability: https://kuppal.shinyapps.io/xmwas (Online) and https://github.com/kuppal2/xMWAS/ (R)

3Omics: a web-based tool for analysis, integration and visualization of human transcriptome, proteome and metabolome data (Kuo 2013, BMC Systems Biology)

- Web-based tool
- Correlation analysis and network visualization
- Additional features:
  - Metabolic pathway analysis
  - Gene ontology enrichment analysis
  - Hierarchical clustering analysis

↓

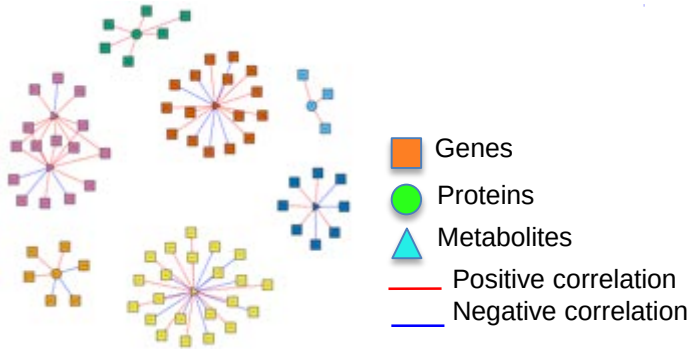
Filtering based on |r|>threshold and p-value<alpha criteria

↓

Community (clusters) detection and centrality (importance) analysis



Sparse Partial Least Squares (PLS) regression method (Cao 2009, Liquet 2012)

- sPLS is a variable selection and dimensionality reduction method that allows integration of heterogeneous omics data from same set of samples
- Robust approximation of Pearson correlation using regression and latent (principal) variates
- Multilevel sparse PLS – accounts for repeated measures
- Eg: transcriptome (matrix X) and metabolome (matrix Y) data

  where,

  matrix X is an $n \times p$ matrix that includes n samples and p metabolites

  matrix Y is an $n \times q$ matrix that includes n samples and q genes

  Objective function

  max $cov(X_u, Y_v)$

  where

  u_1, $u_2 \ldots u_H$ and v_1, $v_2 \ldots v_H$ are the loading vectors

  H is the number of PLS-DA dimensions

  A Lasso based optimization is used to select most relevant variables

Association matrix using the PLS components

→

	X1	X2	-	Xn
Y1	0.4	0.9	-	0.3
Y2	0.7	0.1	-	0.5
Y3	0.1	0.6		0.8

Community detection

- Community: set of densely connected nodes that have more connections with the nodes in the same community as compared to nodes in other communities
- Multilevel community detection: a multi-step procedure

  1) each node is assigned to a different community

  2) each node is moved to a community with which it achieves the highest positive contribution to modularity

  3) Step 2 is repeated for all nodes until no improvement can be achieved

  4) Each community after step 3 is now considered a node and step 2 is repeated until there is a single node left or the modularity can no longer be improved

Centrality analysis

- Centrality: measure of importance of a node in the network
- Common centrality measures
  - Eigenvector: based on the number and quality of connections
  - Betweenness: based on the extent to which a node lies on the path between other nodes
  - Degree.count: based on the number of connections
  - Degree.weight: based on the magnitude of edges (association scores)
  - Closeness: based on the closeness of a node to all other nodes
- Differential centrality analysis: delta centrality between two conditions (e.g. $|centrality_{exposed} – centrality_{control}|$

xMWAS: https://kuppal.shinyapps.io/xmwas/

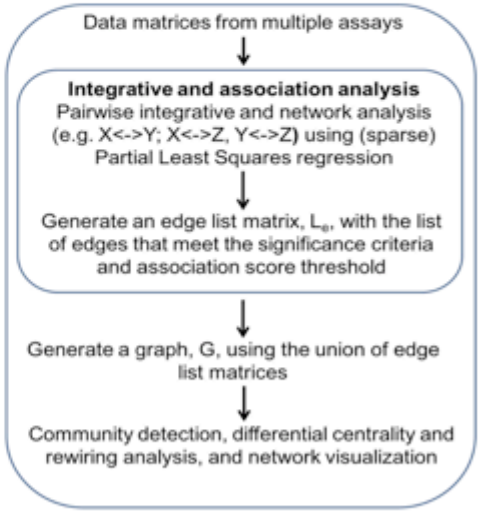
xMWAS - a data-driven integration and network analysis tool (v0.54)

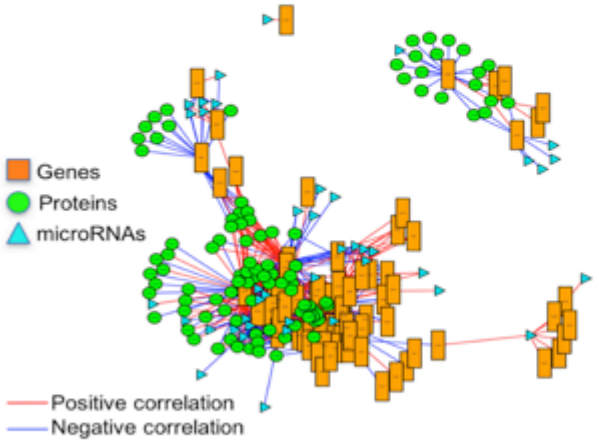
Introduction | Analysis | Help and Support

xMWAS provides an automated workflow for data integration, network visualization, clustering, and differential network analysis of up to four datasets from biochemical and phenotypic assays, and omics platforms.

For installing xMWAS locally in R run:

`library(devtools);install_github("kuppal2/xMWAS")`

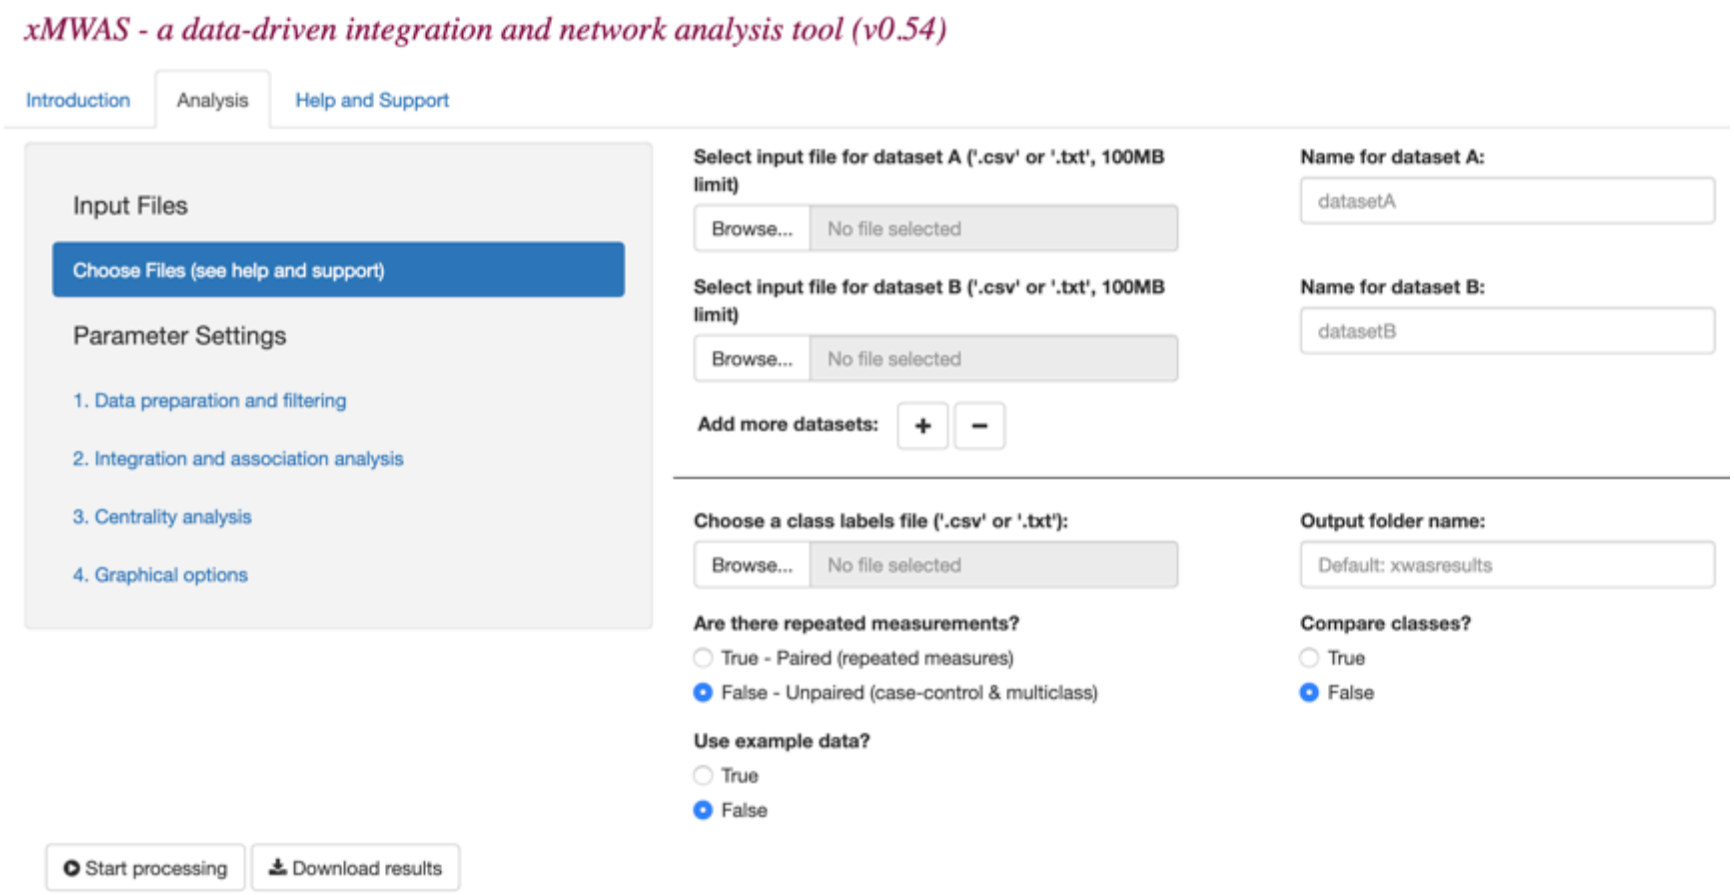




Citation: Uppal K, Ma C, Go YM, Jones DP. xMWAS: a data-driven integration and differential network analysis tool. *Bioinformatics*. 2017 Oct 23. PMID: 29069296

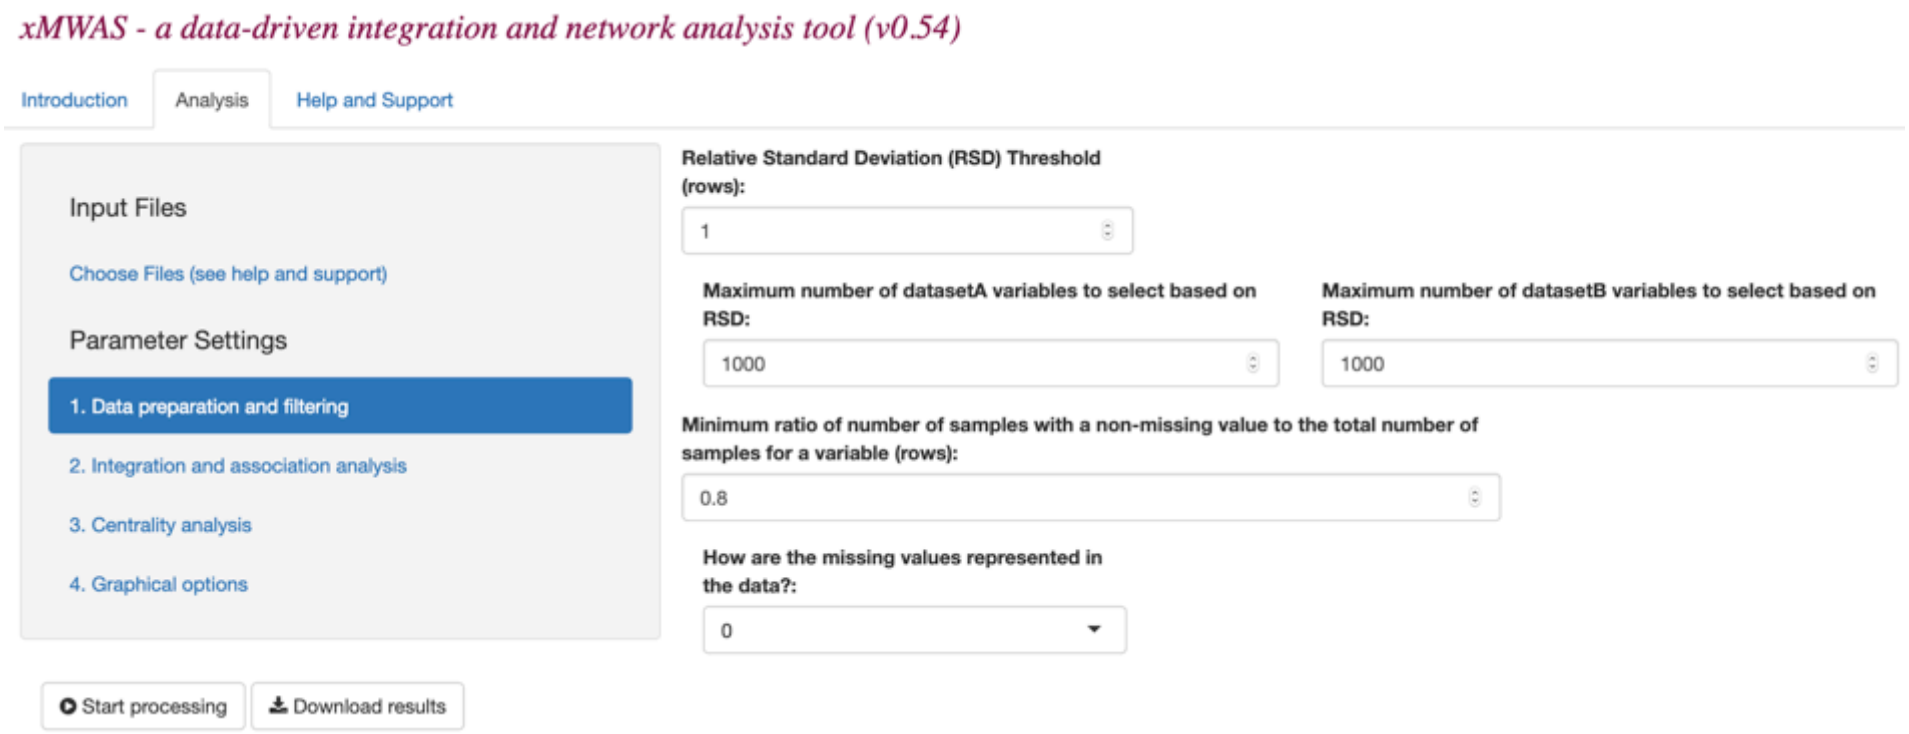
Maintained by Chunyu Ma (chunyu.ma@emory.edu) and Karan Uppal (kuppal2@emory.edu) at Clinical Biomarkers Laboratory , Emory University, Atlanta, GA, USA

Step 1. Upload data files



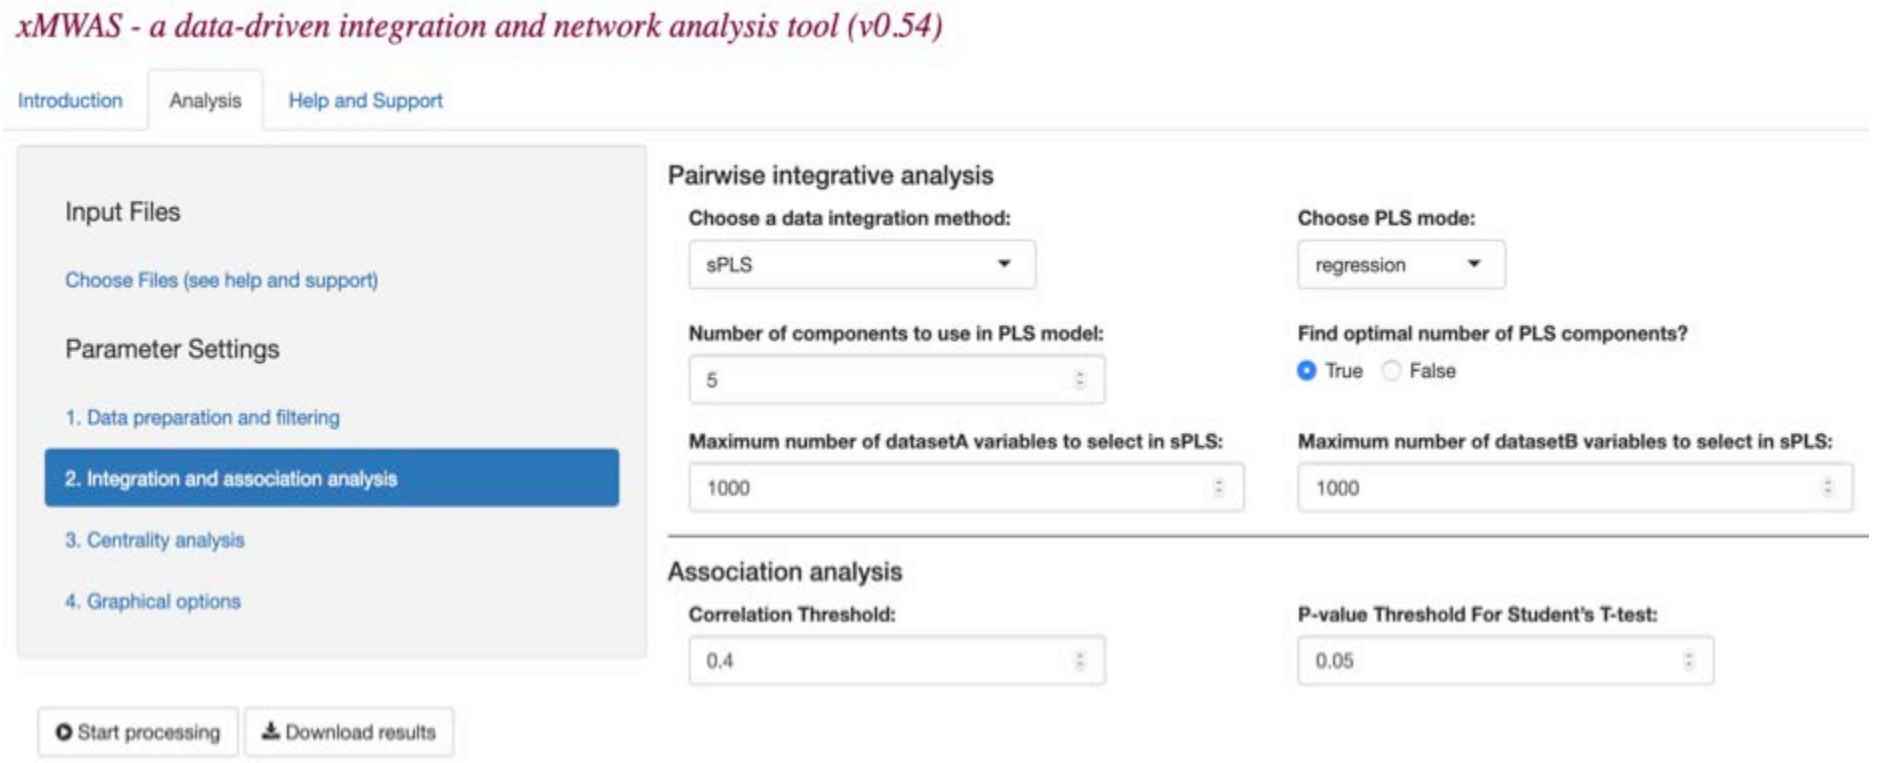
https://kuppal.shinyapps.io/xmwas/
(See: Help & Support)

Step 2. Data preprocessing and filtering



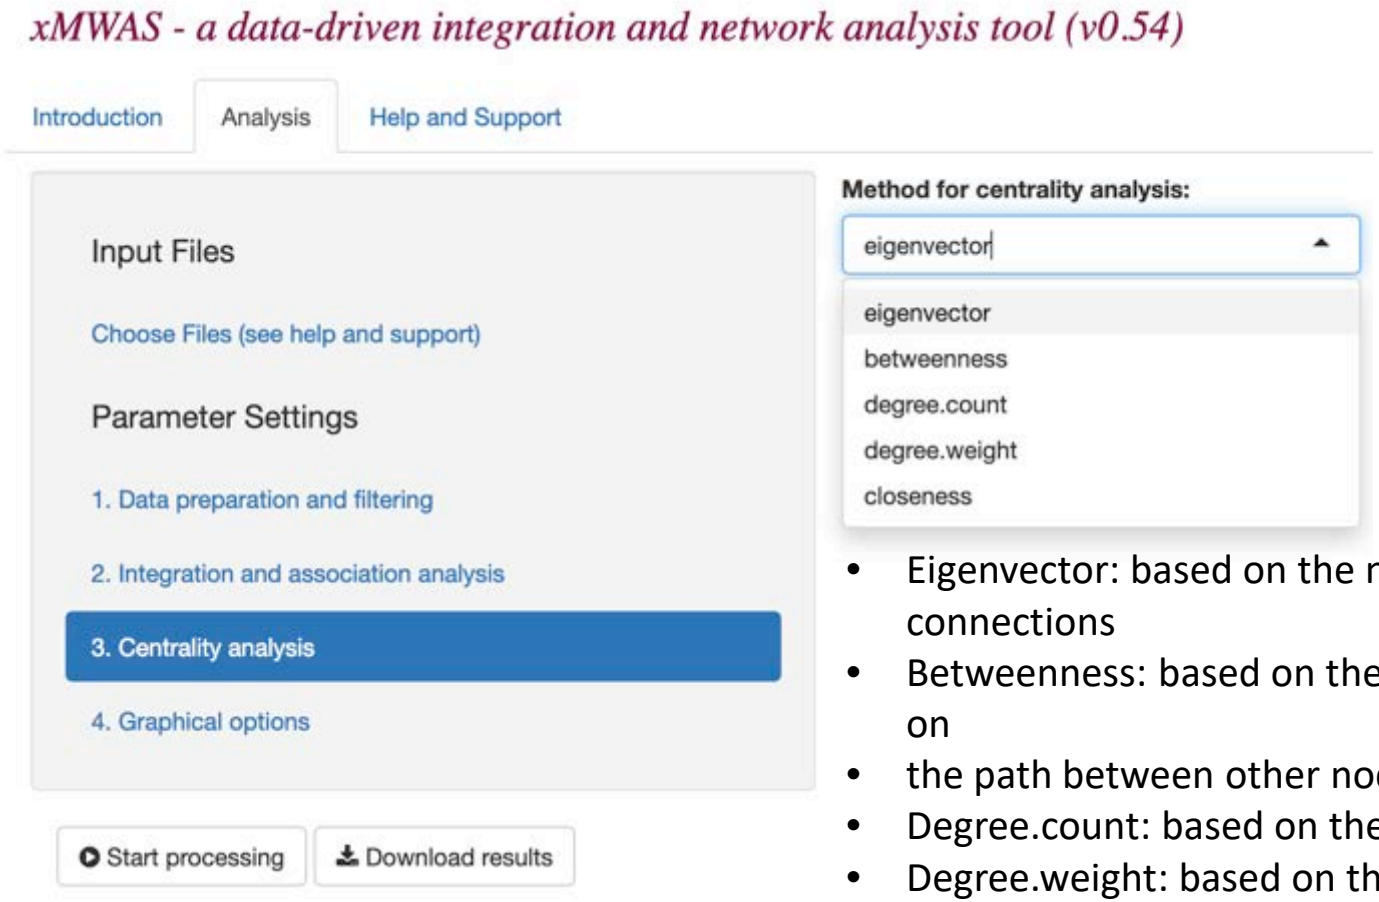
https://github.com/kuppal2/xMWAS/blob/master/example_manual_tutorial/xMWAS-manual.pdf

Step 3. Set parameters for integration and association analysis



https://github.com/kuppal2/xMWAS/blob/master/example_manual_tutorial/xMWAS-manual.pdf

Step 4. Select method for centrality analysis



- Eigenvector: based on the number and quality of connections
- Betweenness: based on the extent to which a node lies on
- the path between other nodes
- Degree.count: based on the number of connections
- Degree.weight: based on the magnitude of edges (association
- scores)
- Closeness: based on the closeness of a node to all other nodes

Step 5. Click on “Start processing”

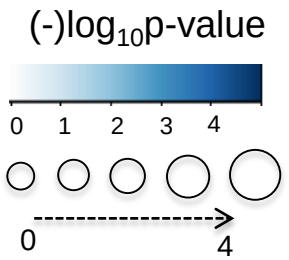
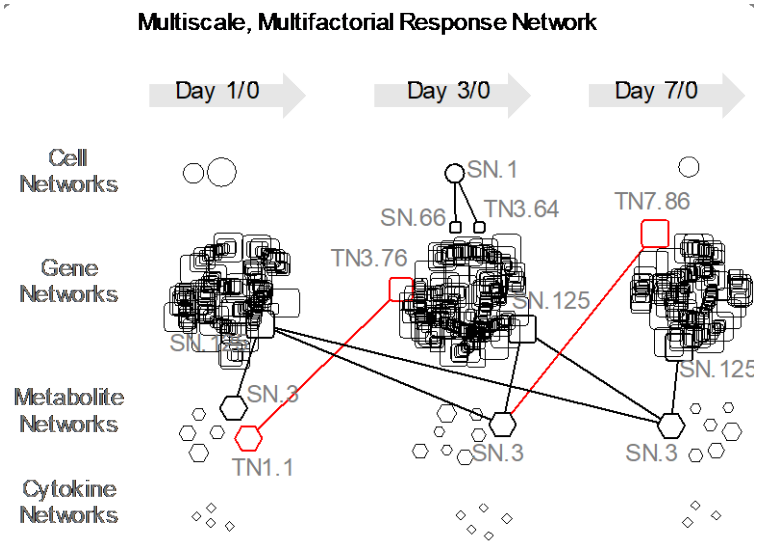
- Bubble plot showing metabolic pathways associated with clinical and environmental exposures data
- Metabolic pathway analysis performed using Mummichog



Current challenges and future work

- Development of hybrid methods
  - combined knowledge-based and data-driven approaches
  - incorporation of literature-derived associations in xMWAS
    - Using co-occurrence criteria for establishing relationship (PolySearch2.0)
- Improving scalability
  - Ability to handle >100,000 variables
  - Performing integrative analysis at communities, clusters, or eigenvariables (first PCs) level



Li et al., 2017. *Cell* 169, 862–877

Summary

- Various tools and techniques are available for integrating and visualization multi –omics data
- Integrative –omics drives systems biology and could play a critical role in personalized medicine

The conformational control inhibitor of tyrosine kinases DCC-2036 is effective for imatinib-resistant cells expressing T674I FIP1L1-PDGFRα.

Shen Y[1], Shi X, Pan J.

Author information

Abstract

The cells expressing the T674I point mutant of FIP1-like-1-platelet-derived growth factor receptor alpha (FIP1L1-PDGFRα) in hypereosinophilics syndrome (HES) are resistant to imatinib and some second-generation tyrosine kinase inhibitors (TKIs). There is a desperate need to develop therapy to combat this acquired drug resistance. DCC-2036 has been synthesized as a third-generation TKI to combat especially the Bcr-Abl T315I mutant in chronic myeloid leukemia. This study evaluated the effect of DCC-2036 on FIP1L1-PDGFRα-positive cells, including the wild type (WT) and the T674I mutant. The in vitro effects of DCC-2036 on the PDGFRα signal pathways, proliferation, cell cycling and apoptosis of FIP1L1-PDGFRα-positive cells were investigated, and a nude mouse xenograft model was employed to assess the in vivo antitumor activity. We found that DCC-2036 decreased the phosphorylated levels of PDGFRα and its downstream targets without apparent effects on total protein levels. DCC-2036 inhibited proliferation, and induced apoptosis with MEK-dependent up-regulation of the pro-apoptotic protein Bim in FIP1L1-PDGFRα-positive cells. DCC-2036 also exhibited in vivo antineoplastic activity against cells with T674I FIP1L1-PDGFRα. In summary, FIP1L1-PDGFRα-positive cells are sensitive to DCC-2036 regardless of their sensitivity to imatinib. DCC-2036 may be a potential compound to treat imatinib-resistant HES.

xMWAS - a data-driven integration and network analysis tool (v0.54)
Introduction
Analysis
Help and Support
Input Files
Choose Files (see help and support)
Parameter Settings
1. Data preparation and filtering
2. Integration and association analysis
3. Centrality analysis
4. Graphical options
Select input file for dataset A ('.csv' or '.txt', 100MB limit)
Browse...
exh1n1_metabolome.txt
Name for dataset A:
metabolome
Select input file for dataset B ('.csv' or '.txt', 100MB limit)
Browse...
exh1n1_transcriptome.txt
Name for dataset B:
transcriptome
Select input file for dataset C ('.csv' or '.txt', 100MB limit)
Browse...
exh1n1_cytokine.txt
Name for dataset C:
cytokine
Add more datasets:
+
−
Choose a class labels file ('.csv' or '.txt'):
Browse...
exh1n1_classlabels.txt
Output folder name:
Default: xwasresults
Are there repeated measurements?
True - Paired (repeated measures)
False - Unpaired (case-control & multiclass)
Compare classes?
True
False
Use example data?
True
False
Start processing
Download results
Output

Parameter Settings
1. Data preparation and filtering
2. Integration and association analysis
3. Centrality analysis
4. Graphical options
Relative Standard Deviation (RSD) Threshold (rows):
1
Maximum number of datasetA variables to select based on RSD:
1000
Maximum number of datasetB variables to select based on RSD:
1000
Maximum number of datasetC variables to select based on RSD:
1000
Minimum ratio of number of samples with a non-missing value to the total number of samples for a variable (rows):
0.7
How are the missing values represented in the data?:
0

3. xMWAS R package installation instructions for Windows

- Install R: https://cran.cnr.berkeley.edu/
- Install R dependencies
  - R command for installation:

```
source("https://bioconductor.org/biocLite.R");
biocLite(c("GO.db","graph","RBGL","impute","preprocessCore"),dependencies=TRUE);
install.packages(c("devtools","WGCNA","mixOmics","snow","igraph","plyr","plsgenomics")
,dependencies=TRUE,type="binary", repos="http://cran.r-project.org")
```

- Install R package xMWAS
  - R command for installation:

```
library(devtools); install_github("kuppal2/xMWAS")
```

- Test installation:
  - R command for loading the package:

```
library(xMWAS)
```

xMWAS R package installation instructions for Mac OS X

- Install Xquartz: https://www.xquartz.org/
- Install R: https://cran.cnr.berkeley.edu/
- Install R dependencies
  - R command for installation:

```
source("https://bioconductor.org/biocLite.R");
biocLite(c("GO.db","graph","RBGL","impute","preprocessCore"),dependencies=TRUE);
install.packages(c("devtools","WGCNA","mixOmics","snow","igraph","plyr","plsgenomics")
,dependencies=TRUE,type="source", repos="http://cran.r-project.org")
```

- Install R package xMWAS
  - R command for installation:

```
library(devtools); install_github("kuppal2/xMWAS")
```

- Test installation:
  - R command for loading the package: **library(xMWAS)**

R script for xMWAS using the example dataset (URL: https://github.com/kuppal2/xMWAS/blob/master/example_manual_tutorial/example_xmwas_runscript_v0.5.R)

```
#load package

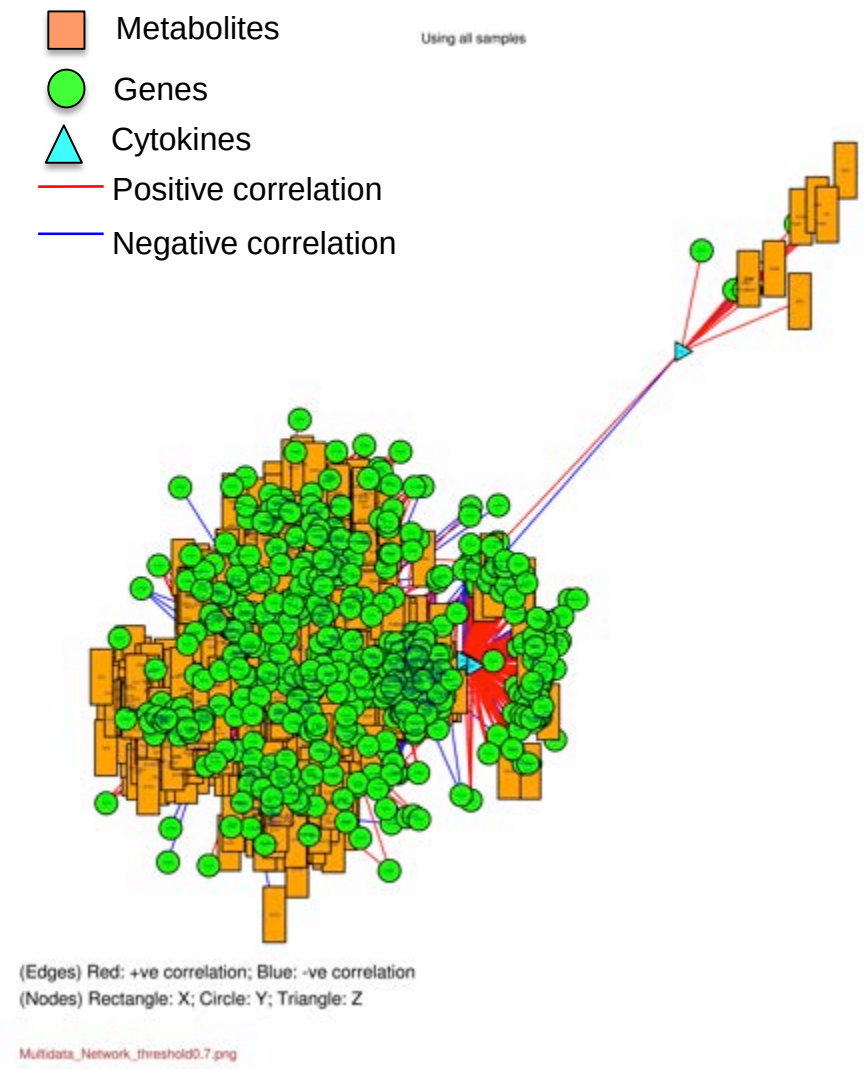
Description of output: Readme.txt

README.txt

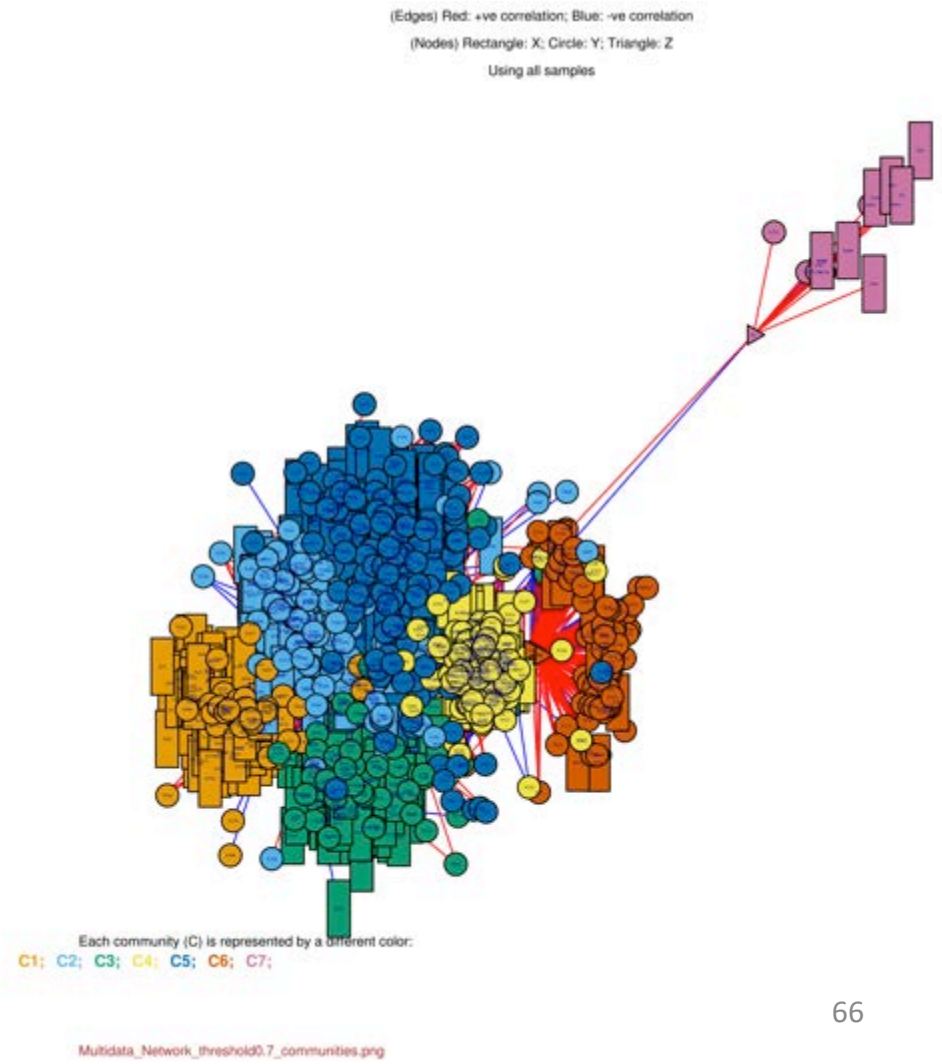
"Description of files"
"1: X labels correspond to xome_fname data, Y labels correspond to yome_fname data, Z labels correspond to zome_fname data, W labels correspond to wome_fname data"
"2: Pairwise integrative analysis results are under pairwise_results. The files corresponding to each pairwise comparison (X<->Y, X<->Z, Y<-Z,..) are: XYassociation_matrix_corthresh0.9.txt (correlation matrix with mapping between node labels and original variable names), XYassociation_networkthresholdX.pdf that includes the pairwise network plots, XYBoolean_association_matrix_corthreshX.txt (same as correlation matrix bu correlations meeting the threshold are represented 1, and 0 otherwise)"
"3: Multiome_Network_corthreshx.pdf: includes multiome network plot using all significantly associated variables."
"4: Multiome_Network_corthreshx_communities.pdf: includes multiome network plot with the communities identified using the multilevel community detectic algorithm. Members of each community are assigned colors based on community/module/cluster membership (1: orange; 2: light blue; 3: dark green, and so on)."
"5: MultiOme_Network_corthreshxcytoscape.gml: GML file for all significantly associated variables that can be uploaded to Cytoscape"
"6: The cluster_membership_centrality_mapped.txt file includes community detection results using the multilevel community detection algorithm and the centrality measures."
"7: The matrix_centrality.txt file includes the centrality measures across different conditions for nodes that meet the association criteria and include in the association networks."
"8: If the classlabels are provided, network analysis is performed for samples from each class. The results ar written in individual subfolders."

Network graphs

A. Colored by data type



B. Colored by community membership



Community detection and centrality analysis
