Peaks to pathways in Metaboanalyst

- **This feature was added in 2019 and is part of version 5.0**
- **Necessary to recover the normalized data from the stats analysis**
 - Go to the download zip file and open the data.normalized file
- **In the current version, necessary to transpose the normalized data**
 - Then undo the concatenated format to get m/z and RT values
 - Calculate p-values and t-scores for each of the feature
 - The format and order of the headers is critical
 - m.z, r.t, p.value and t.score

2

Steps for today's class (1)

- **Start with the Excel file sent to you (has named +ve metabolites in a study with two groups plus three pooled samples)**
 - Determine the mean, standard deviation and CoV for the values in the three pooled samples
 - Determine the ratio of the mean values to those in the three extraction blanks
 - Where the Ratio is < 10, insert a line space – those that are below this line can be discarded
- **Note that the group numbers are on the second line (keep these)**
- **Delete the lines where a drug has been identified**
- **Sort the data by the m/z value (from low to high) – do not include the first two lines**

3

After calculating CoV and ordering by ratio

5

Next steps

- **Move columns B, C and D to a new file**
- **Add the pooled samples and the individual samples to this new file**
 - You do not need to copy the extraction blanks, mean SD, CoV and ratio columns
 - Save the file (class database)
- **Make a copy of this file and delete those features that are drugs**
 - Save this file, too (class database-2)
- **In the new file, RT is in column A, and m/z is in column B**
 - Add two new columns after column B
 - In cell C3, enter a concatenate command as follows
 - =concatenate(round(B3,3),"/",round(A2,2))
 - Copy to the bottom of the column C
 - Copy column C and paste special (values) in column D
 - Delete columns A, B and C

6

Class database-2

MetaboAnalyst 5.0 - user-friendly, streamlined metabolomics data analysis

News & Updates

- MetaboAnalyst 5.0 is launched! [📄](#)
- Please help complete the [User Survey on behalf of TMIC](#). You could win \$100 Amazon Gift Card! [📄](#)
- Added support for merging technical replicates with different mathematical models and QC measures (02/18/2021); [📄](#)
- Updated KEGG IDs in internal compound databases (02/09/2021); [📄](#)
- Enhanced name handling to better accommodate special characters in compound/lipid names (02/09/2021); [📄](#)
- Added [seven tutorials](#) introducing new features in MetaboAnalyst 5.0 (01/15/2021); [📄](#)
- Users can perform meta-analysis of global metabolomics data using [Functional Meta-analysis](#) module as illustrated in our [COVID-19 paper](#) (01/09/2021); [📄](#)
- Updated the KEGG global metabolic map for better metabolome coverage (01/08/2021); [📄](#)
- Users can now enter [Study IDs](#) to analyze data deposited in the [Metabolomics Workbench](#) (12/20/2020); [📄](#)
- Users can [Start New Journey](#) from the [Download page](#) to explore other modules at the end of each session (12/14/2020); [📄](#)
- Expanded compound database for lipids (>150,000 lipids) together with a smart compound name matching algorithm (12/10/2020); [📄](#)
- Upgraded all main interactive plots using ChartJS; enhanced Enrichment module and Pathway Analysis module (12/07/2020); [📄](#)

Statistical Analysis

This module offers various commonly used statistical and machine learning methods including t-tests, ANOVA, PCA, PLS-DA and Orthogonal PLS-DA. It also provides clustering and visualization tools to create dendrograms and heatmaps as well as to classify data based on random forests and SVM.

Biomarker Analysis

This module performs various biomarker analyses based on receiver operating characteristic (ROC) curves for a single or multiple biomarkers using well-established methods. It also allows users to manually specify biomarker models and perform new sample prediction.

9

Please upload your data

A plain text file (.txt or .csv):

Data Type: Concentrations Spectral bins Peak intensity table

Format:

Data File: class_metaboanalyst

Data Integrity Check:

1. Checking the class labels - at least three replicates are required in each class.
2. If the samples are paired, the pair labels must conform to the specified format.
3. The data (except class labels) must not contain non-numeric values.
4. The presence of missing values or features with constant values (i.e. all zeros).

Data processing information:

Checking data content ...passed.
 Samples are in columns and features in rows.
 The uploaded file is in comma separated values (.csv) format.
 The uploaded data file contains 23 (samples) by 145 (peaks(mz/rt)) data matrix.
 Samples are not paired.
 3 groups were detected in samples.
 Only English letters, numbers, underscore, hyphen and forward slash (/) are allowed.
 Other special characters or punctuations (if any) will be stripped off.
 All data values are numeric.
 A total of 0 (0%) missing values were detected.
 By default, missing values will be replaced by 1/5 of min positive values of their corresponding variables.
 Click the **Skip** button if you accept the default practice;
 Or click the **Missing value imputation** to use other methods.

10

Filtering features if their RSDs are > % in QC samples

None (less than 5000 features)

Interquartile range (IQR)

Standard deviation (SD)

Median absolute deviation (MAD)

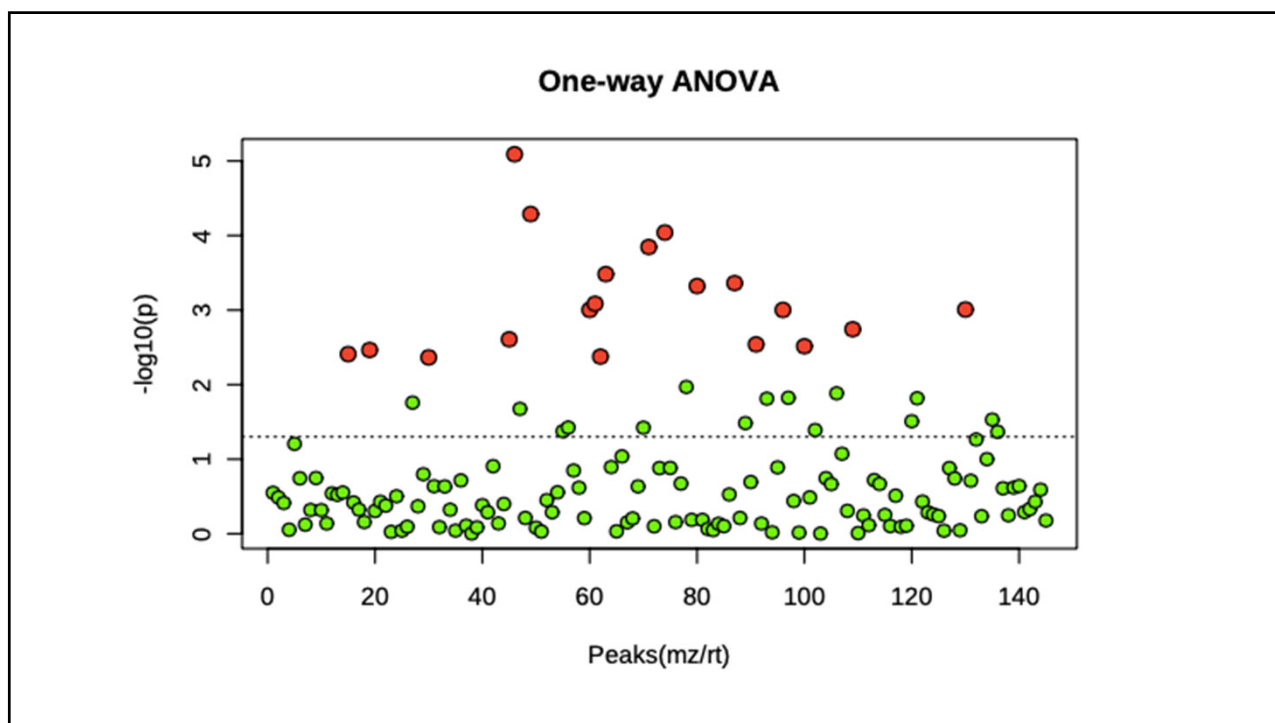

Relative standard deviation (RSD = SD/mean)

Non-parametric relative standard deviation (MAD/median)

Mean intensity value

Median intensity value

Text to columns

The Text Wizard has determined that your data is Delimited.

If this is correct, choose Next, or choose the Data Type that best describes your data.

Delimited - Characters such as commas or tabs separate each field.

Fixed width - Fields are aligned in columns with spaces between each field.

Preview of selected data:

```

Preview of selected data:
1 Label
2 61.039/0.53
3 76.076/0.55
4 86.097/1.38
5 86.097/0.87
6 100.075/1.95
7 100.076/1.85

```

Cancel < Back Next > Finish

This screen lets you set the delimiters your data contains.

Enforce Primary Ions (V2 only):

Data File: Choose File class_p2p

33

Data Integrity Check:

1. Checking the class labels - at least three replicates are required in each class.
2. If the samples are paired, the pair labels must conform to the specified format.
3. The data (except class labels) must not contain non-numeric values.
4. The presence of missing values or features with constant values (i.e. all zeros).

Data processing information:

Checking data content ...passed.

A total of 145 m/z features were found in your uploaded data.

The instrument's mass accuracy is 5 ppm.

The instrument's analytical mode is **positive**.

The uploaded data contains 4 columns.

The column headers of uploaded data are **m.z, p.value, t.score, r.t**.

The range of m/z peaks is trimmed to 50-2000. 0 features have been trimmed.

A total of 145 input m/z features were retained for further analysis.

34

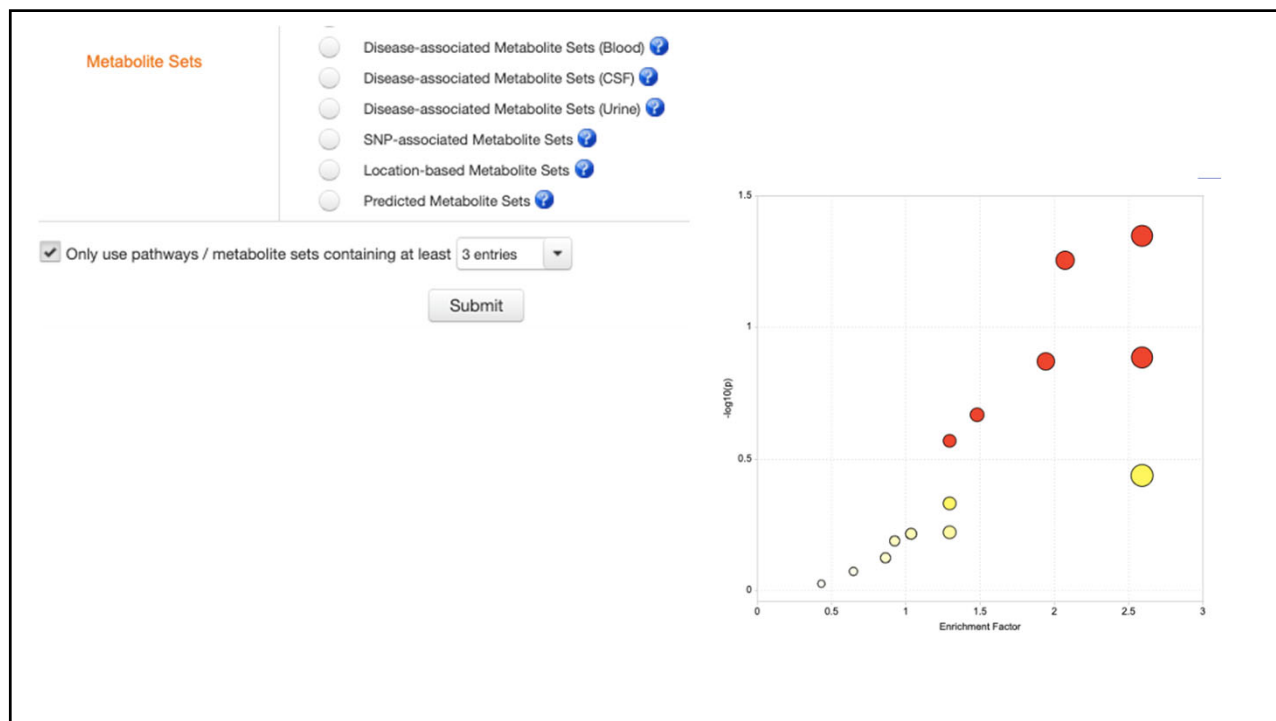

Specify analysis parameters:

The colored compounds indicate potential matches from the user's input, with red colors indicating significant hits and blue colors indicating non-significant hits. Note for users running V2, the number of hits listed in the results table will be lower than the number of compounds shown below. This is because the analysis is performed in the Empirical Compound space, and for the sake of interpretability, we show which compounds were matched instead. For more information, please refer to the FAQs.

Changing the background to white and using red/green for “expression”

41

Magnifying the previous slide

42

How could this package be improved?

- What we submitted were the m/z and RT values of “known” compounds
- There is a risk that since the m/z value does not have accompanying MSMS data as submitted, the interpretation of that value may be erroneous
- It would be better if the name of the metabolite could be used instead
- MZ-tab may be the answer
